- Cadence Xcelium ML
- Application on Designs
- Xcelium ML vs Ranking
- Proposed Methodology
- Summary

# Verification of Systems on Chip became a time-consuming task

- Designs are becoming more complex, due to
  - Technology scaling: Ability to fabricate more
  - Consumer demands more from a single chip
  - Mixed-signal designs
  - Safety/Security critical devices and more...
- At present, pre-silicon verification typically consumes significantly more effort than design

# Money and time are crucial...

- **Problem:** Huge number of test simulations in the Regression
  - High demand for simulator licenses
  - Long turn-around times
  - Uncertainty in coverage regain
- **Goals:**

# Common Solution used so far - Ranking

**Definition:** A collection of test-seed pairs of the original regression to reach its achieved coverage

- **Pro:**

- Easy
- built-in (e.g. vManager)
- Proven technology

- **Con:**

- Effectively re-simulation (like directed testing)
- Exact same coverage as original regression
- Inability to hit new coverage/ identify new bugs

Subset - same coverage as original regression

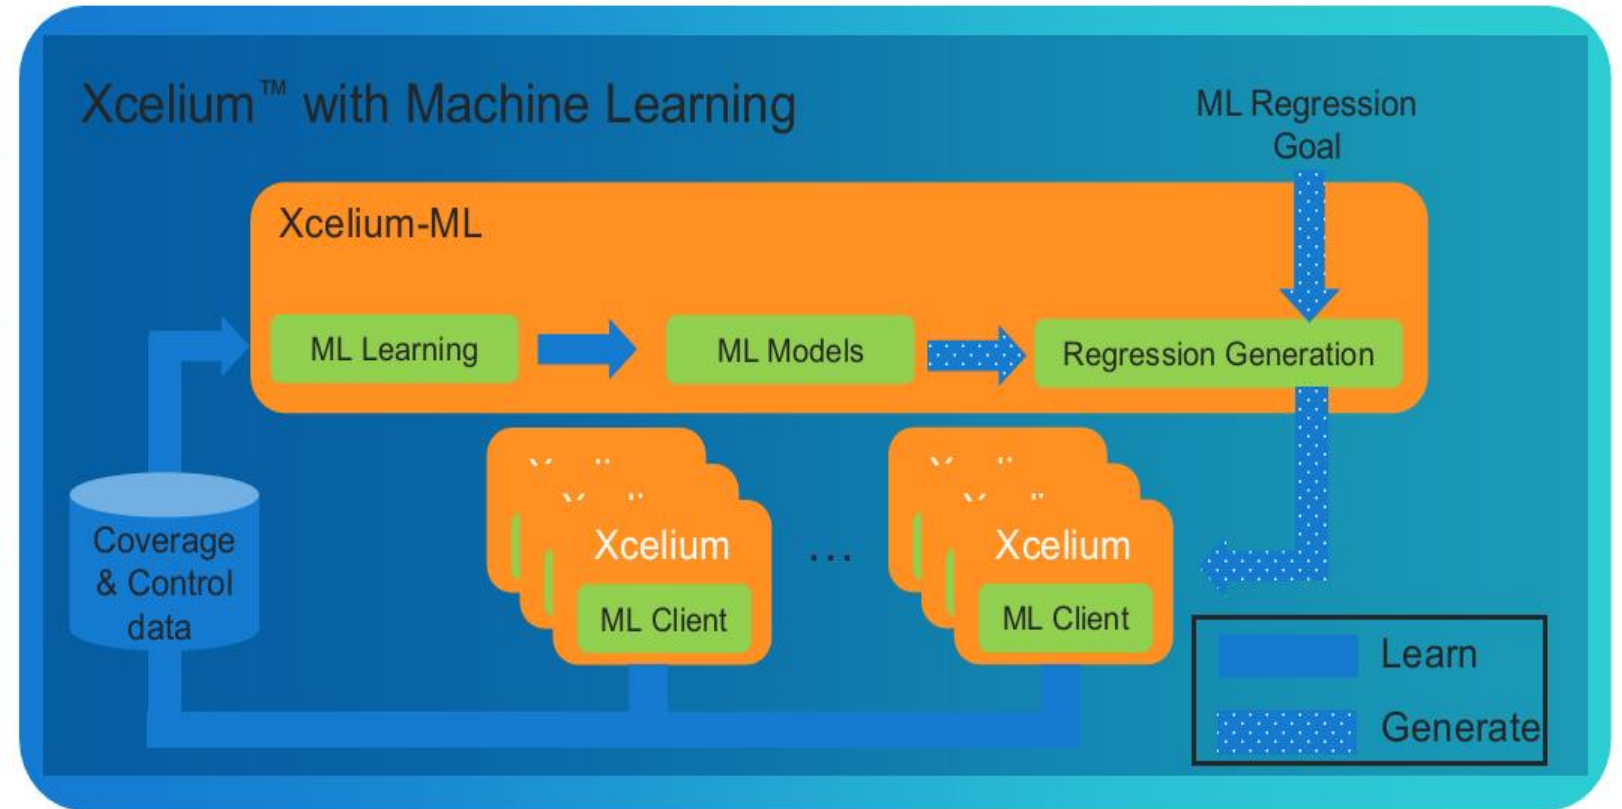

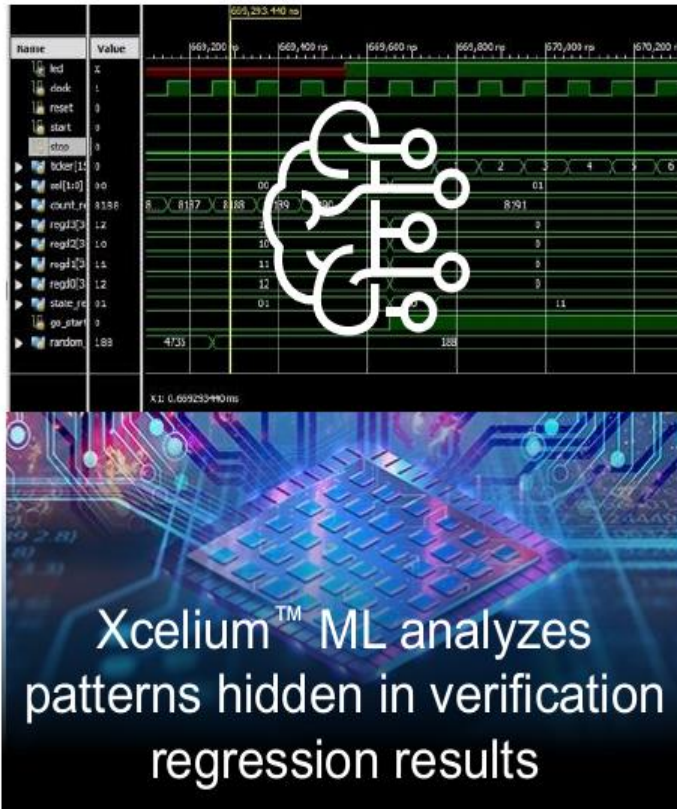

Name	cov_4(Rank)	delta_cov_4(Rank)	Index	Seed
/uart_tests/apb_uart_rx_tx	51.98%	51.98%	12	-1822347563

/uart_tests/apb_to_uart_1stopbit	53.39%	0%	5	-268307533
/uart_tests/apb_to_uart_1stopbit	53.39%	0%	6	671173104
/uart_tests/apb_uart_rx_tx	53.39%	0%	7	402738760

No additional coverage contribution, can be neglected for ranked regression

# Faster Regressions with Xcelium ML

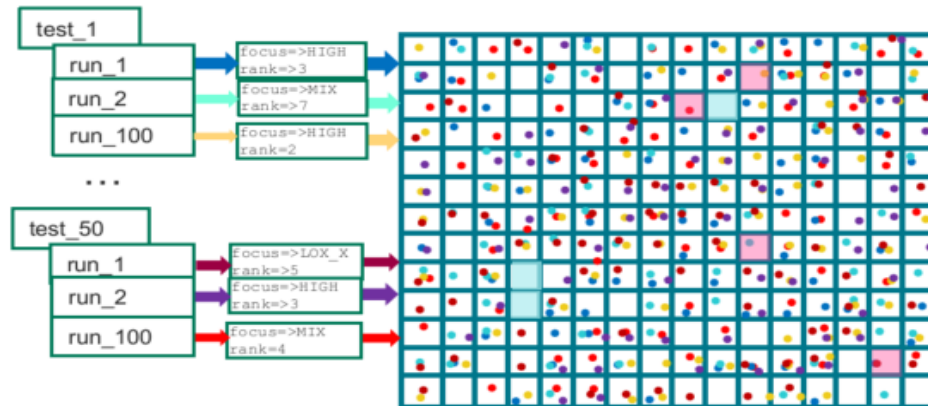

## Original Regression

- 50 tests, 100 seeds per test (5,000 runs)

### Random control

```
class cfg_c extends uvm_sequence_item;  
  rand focus_e focus;  
  rand [2:0] rank;  
  ...  
endclass  
  
function void test::setup();  
  cfg_c cfg = get_config();  
  cfg.randomize();  
  set_config_info(cfg);  
endfunction
```

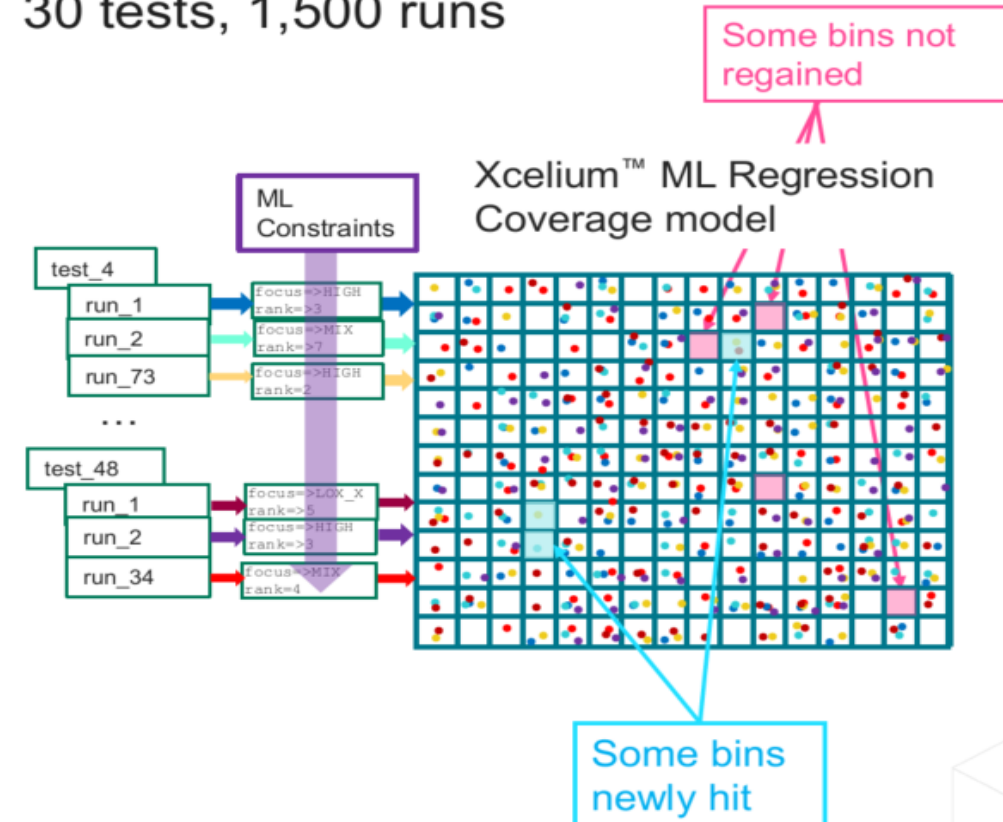

### Original Regression Coverage model

Generate new regression runs

## Generated Regression

30 tests, 1,500 runs

- Summary

# Application on an SoC Design - Overview

- Mixed Signal SoC
- Designed in VHDL, Verilog, SystemVerilog
- UVM (SV) testbench
- 356 Distinct Tests
- $\approx 5124$  runs in the Regression

Configuration	CPU	Verification IP	Flash
P1	Yes	No	Simple
P2	Yes	Yes	Complex
P3	Yes	Yes	Simple
P4	No	No	Complex
P5	No	No	Simple

P6	10	0.007	3	0.003	3.33	98.19%	2.33
P7	110	0.074	84	0.070	1.30	101.3%	1.05
Total	5124	5.205	1605	1.835	3.19	99.42%	2.83

# Application on other Designs

- **Microprocessor Digital IP**

- VHDL design
- UVM-SV testbench
- Already taped out
- 260 runs with 26 distinct tests
- Results (XceliumML)
  - 6x - 17x speed-up factor
  - $\approx$  99.9% coverage regain

- **Radar based SoC**

- System Verilog design
- UVM-SV testbench
- Ongoing project
- 25 tests/ 271 runs @ Stage I
- 35 tests/ 301 runs @ Stage II
- Results (XceliumML):
  - 3x speed-up factor
  - Over 100% coverage regain
  - Able to discover more functional bugs

# Agenda

- Motivation and Problem Statement
- Cadence Xcelium ML
- Application on Designs
- **Xcelium ML vs Ranking**
- Proposed Methodology
- Summary

# Xcelium ML vs Ranking

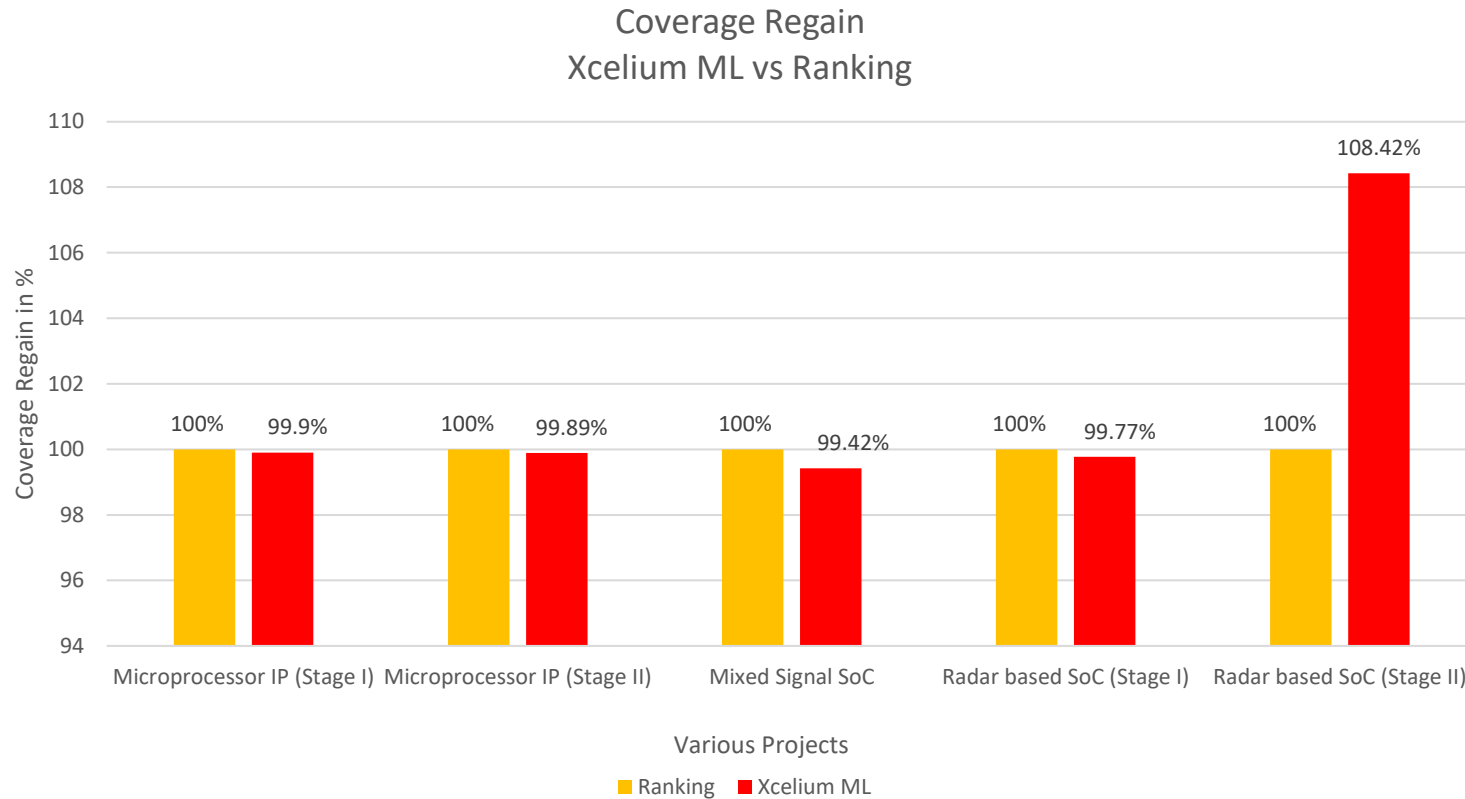

## Xcelium ML

- ML tries to find the correlations between the actions inside the testbench and the coverage results
- The produced regression by ML is randomized in nature
- It can improve/ increase the original coverage
- It can discover new functional bugs that the orig regr did not find

## Ranking

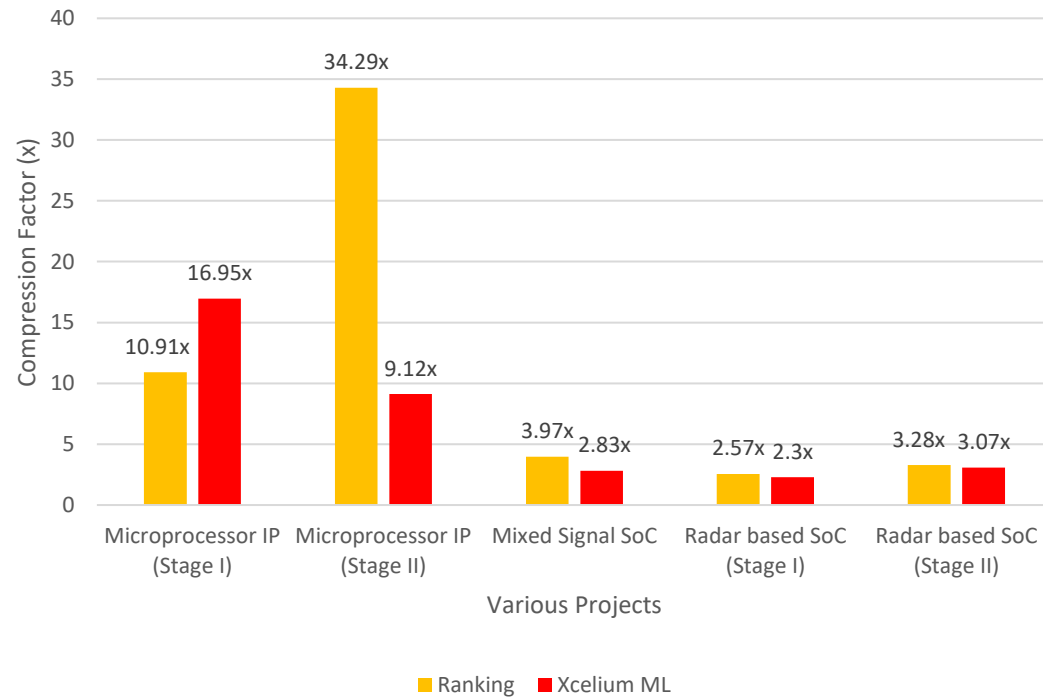

- Ranking finds the effective test and seed pairs to reach the same coverage
- Re-simulation of tests → Directed testing
- Inability to exercise new scenarios
  - No new coverage
  - Can not identify the bugs

# Proposed Methodology using Xcelium ML

# Agenda

- Motivation and Problem Statement
- Cadence Xcelium ML
- Application on Designs
- Xcelium ML vs Ranking
- Proposed Methodology
- Summary

# Summary

- Out of the box solution with minimal setup
- Time & cost savings during simulation regression
- 3x to 15x speed-up factor
- Generates a compressed regression with random seeds (unlike Ranking)
  - Uncover new functional bugs
  - Might exceed original coverage
- ML learning/ training consumes extra 20% (on average) of the original regression time to produce an optimized regression
- Re-learning required after significant RTL/ TB changes (typically every week)

Thank you.
